

DETAILED ACTION

Election/Restrictions

1. Applicant's election without traverse of Group I (claims 1-17) in Paper No. 8 is acknowledged.

Claims 18-20 are withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected invention, there being no allowable generic or linking claim.

Election was made **without** traverse in Paper No. 8.

Drawings

2. FIG. 1 and FIG. 2 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g).
3. The drawings are objected to as failing to comply with 37 CFR 1.84(p)(4) because reference character "B" has been used to designate both a sensor TFT area and phosphor area. Correction is required.

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claims 1 thru 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over applicant's admitted prior art in view of Rosenthal et al. '787. Applicant's admitted prior art

Art Unit: 2815

discloses (see, for example, FIG. 2) a semiconductor device comprising a switch SW1, light source 8, sensing part (sensor) 6, electrical power source 4, and controller 2. The admitted prior art does not a conductive object detection pattern. However, Rosenthal discloses (see, for example, FIG. 2B) a device wherein two flanges (conductive object detection pattern) 110 detect the presence of a finger F. The presence of finger F provides a short circuit through the flanges and allows a current to go to the controller 150. It would have been obvious to one of ordinary skill in the art at the time of invention to replace the switch of the applicant's admitted prior art with the two flanges of Rosenthal in order to be able to detect the presence of fingers in a semiconductor device and conduct a signal to the controller.
